

I am looking for a scraper that can do the following. When I enter a question (e.g. “What do horses eat”) on Google, I would like to scrape and save the additional questions under “People Also Ask” on the results page. See the below image for exact details.

Ideally, I would be able to pass an array/list of search terms, scrape all the “People also ask” from each one, and save it to a db (postgres preferred) or return it via an api to my (currently nonexistent) frontend.

It would also be highly impressive if this could click on each of the questions which opens more questions below, giving more results per scrape.

If this goes well there will be more, similar work in the future.
